MSc CO

Autumn Term Weeks 7-11

Morris Sloman & Anandha Gopalan

m.sloman@imperial.ac.uk
Room 575

Course Objectives

What is an operating system, and how it supports the implementation of software on a computer.

Understand the features and mechanisms that underlie operating systems, including:

- process and thread synchronization
- memory management
- security
- input-output
- file systems

Linux characteristics as a case study

Outline

Morris Sloman (13 lectures/tutorials)

- Overview: function and structure
- Processes and Threads: concepts and scheduling
- Process synchronization
- Deadlocks

Anandha Gop

- Memory Management: virtual memory
- Input/Output: device drivers, disk management & scheduling
- File Systems: files and directory structures

Course Structure

Six lectures/tutorials per week (Weeks 7 – 11)

Times: Mondays 2-4pm, Wednesdays 11-1pm,
Fridays 11-1pm

Course slides are on Cate **Assignment Project Exam Help**

Acknowledgements: <https://eduassistpro.github.io/>

Slides based on material by Peter Piet **Add WeChat edu_assist_pro** n Cadar
and Julie McCann

Recommended Books

1. **Modern Operating Systems: Global Edition**, A. Tanenbaum, H. Bos, 4th edition, Pearson, 2015
2. **Operating Systems – Internals and Design Principles**, W. Stallings, 8th Edition, Pearson, 2014
3. **Operating System Concepts**, A. Silberschatz, P. Galvin, G. G. Kley & Sons, 2014

Computer Architecture Overview

Processor

- Controls computer hardware
- Executes instructions and programs

Memory

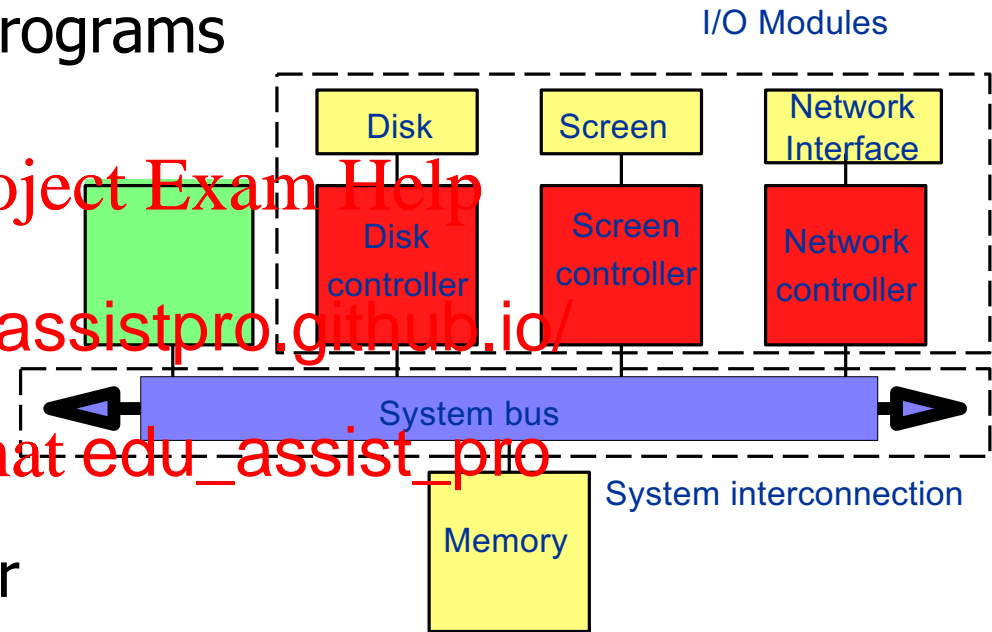

- Stores data and programs

I/O modules

- Read and write from I/O devices
- Intelligence in I/O controller

System interconnection

- Connects different hardware components via bus
- Provides communication between hardware components

Operating Systems – Top Level View

1. Resource Management

Making efficient use of (limited) available resources

- Optimise utilisation of processor, memory, disks, network etc....

Assignment Project Exam Help

Sharing resource <https://eduassistpro.github.io/>

- Schedule access, fair allocation
- Prevent interference

Add WeChat edu_assist_pro

Resources

Processors

- Divide number and/or time

Memory

- RAM, cache, disks, ...

Input/Output devices

- Screens, printers, ...

Internal devices

- Clocks, timers, accelerometers

Long-term storage (files)

- Disks, storage cards, DVD, tapes, ...

Software

- Browsers, editors, e-mail clients, databases,

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

2. Providing Clean Interfaces

OS converts raw hardware into usable computer system

- Hides complexity of lower levels from higher levels

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

Virtual Machine Abstraction

Details of hardware kept hidden from programs
Only OS can allow access to hardware resources
User request should be abstract

- e.g. no need to know how files stored on disk

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

User Program

Virtual Machine Facilities

Simplified I/O: Device independence; open a file on disk, CD, screen is one operation.

Virtual Memory: Larger than real or partitioned.

Filing System: Long term storage, on disk or tape, accessed by symbolic names.

Program Interaction: Pipes, semaphores

Network communication: M

Protection: Prevent programs accessing resources not allocated to them.

Program Control: User interaction with programs, command language, shells.

Accounting & Management Information: Usage of processors, memory, file storage etc.

OS Characteristics: Sharing

Sharing of data, programs and hardware

- Time multiplexing and space multiplexing

Resource allocation

- Efficient and fair use of memory, CPU time, disk space, ...
- Simultaneous <https://eduassistpro.github.io/>
 - Processor, Disks, RAM, cod
- Mutual exclusion [Add WeChat edu_assist_pro](#)
 - Protect multiple programs from uncontrolled access to shared resources.
 - Prevent multiple writes to same data structure or file.
- Protection against corruption
 - Accidental or malicious

OS Characteristics: Concurrency I

Several simultaneous parallel activities

- Overlapped I/O & computation
- Multiple users and programs run in parallel

Switch activities at arbitrary times

- Guarantee fairness
- Differential responsiveness interactive vs. batch

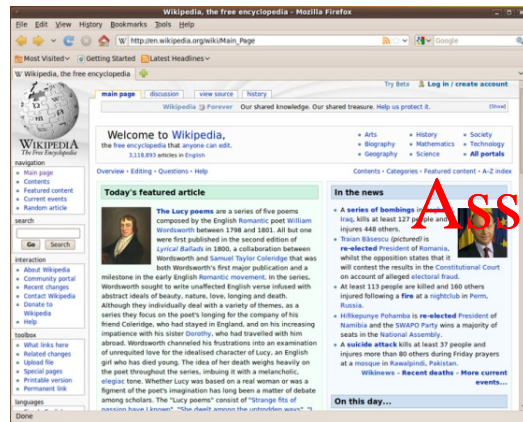

Safe concurrency

- Synchronisation of actions
 - Avoids long waiting cycles; gives accurate error handling
- Protection from interference
 - Each process has its own space

OS Characteristics: Concurrency II

Time-slicing

- Switch application running on physical CPU every 50ms

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

time

What other switching mechanisms are feasible?

OS Characteristics: Non-determinism

Non-determinism

- Results from events occurring in unpredictable order
 - e.g. timer interrupts, user input, program error, network packet loss, disk errors, . . .
- Makes programming OS hard!

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

OS Characteristics: Storing Data

Long term storage: File systems for disks, DVDs, memory cards

- Easy access to files through user-defined names
 - Directory structure, links, shared disks
- Access controls
 - Read, write, permissions
- Protection against corruption
 - Daily/weekly/monthly, partial
- Storage management for easy expansion
 - Add disks without need for re-compilation of OS

Mentimeter: www.menti.com OS Function Q 40 52 35

Non-determinism

Operating System Zoo

Desktop/Laptop (e.g. Windows, Mac OS X, Linux)

- Typically 2-8 cores
+ high resolution screen

Server OS (e.g. Linux, Windows, Server 20XX, Solaris, FreeBSD,)

- Share hardware/s resources e.g. int
- Typically many multicore processors + large disks

Smartphones (e.g. iOS, Android)

- Simpler CPUs, starting to be sophisticated

Real-time OS

- Guaranteed time constraints

Embedded OS (e.g. QNX, VXWorks)

- Transport, communications, banking, homes etc.
- Only trusted software

IoT OS

- single function
ave JVM
- OS is primitive

Sensor Network OS (e.g. TinyOS)

- Resource/energy conscious

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

Resource Management Question

What are the most important resources that must be managed by the OS for the following computers?

Supercomputer

Assignment Project Exam Help

Workstations connected via a network

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

Smartphone

OS Structure

Monolithic OS kernels (e.g. Linux, BSD, Solaris, ...)

- Single black box

Microkernels (e.g. Symbian, L4, Mach, ...)

- Little as possible

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Hybrid kernels (e.g. Windows NT, ...)

- Take a guess... 😊

Add WeChat edu_assist_pro

Monolithic Kernels

Kernel is single executable
with own address space

user
mode

- Structure implied through pushing parameters to stack and trap (systems calls)

- Most popular ker

Advantages

- Efficient calls within kernel
- Easier to write kernel components due to shared memory

Disadvantages

- Complex design with lots of interactions
- No protection between kernel components

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

Microkernels

Minimal “kernel” with functionality
in user-level servers

- Kernel does IPC
(message-passing)
between servers
- Servers for device
file access,
process scheduling

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

Advantages

- Kernel itself not complex → less error-prone
- Servers have clean interfaces
- Servers can crash and restart without bringing kernel down

Disadvantages

- High overhead of IPC within kernel

Hybrid Kernels

Combines features of both monolithic and microkernels

- Often a design philosophy

Assignment Project Exam Help

Advantages

<https://eduassistpro.github.io/>

- More structured design

Add WeChat edu_assist_pro

Disadvantages

- Performance penalty for user-level servers

menti.com Kernel Q 40 52 35

Assignment Project Exam Help

Int

<https://eduassistpro.github.io/>

linux

Add WeChat edu_assist_pro

Linux History and Motivation

Variant of Unix like FreeBSD, System V, Solaris etc.

- Ken Thomson left Multics (Bell Labs)
 - *Uniplexed* information and computing service
- Dennis Ritchie got interested

Late 80's: 4.3 BSD and System V r3 dominant

- Systems call library

1987 Tanenbaum released MINIX

- Tractable by single person (kernel)

Linus Torvalds, frustrated, built fully-featured yet monolithic version → Linux

- Major goal was interactivity, multiple processes and users
- Code contributed by world-wide community

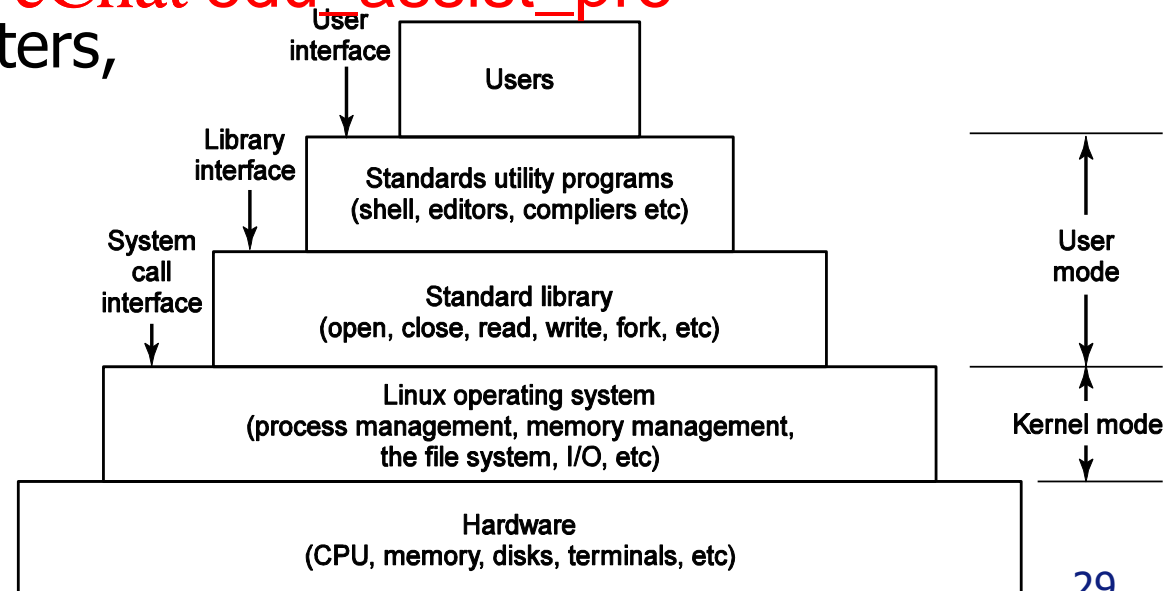

Structure and Interfaces

System calls

- Implemented by putting arguments in registers (or stack)
- Issue trap to switch from user to kernel

Rich set of programs

- e.g. shells (bash, sh, csh, ksh, zsh, etc.)
- Desktop environments: GNOME, KDE, Xfce, etc.
- Utility programs: file, filters, editors, compilers, text processing, sys admin, etc

Kernel Structure

Interrupt handlers primary means to interact with devices

- Kicks off dispatching
 - Stop process, save state and start driver and return
- Dispatcher written in assembler

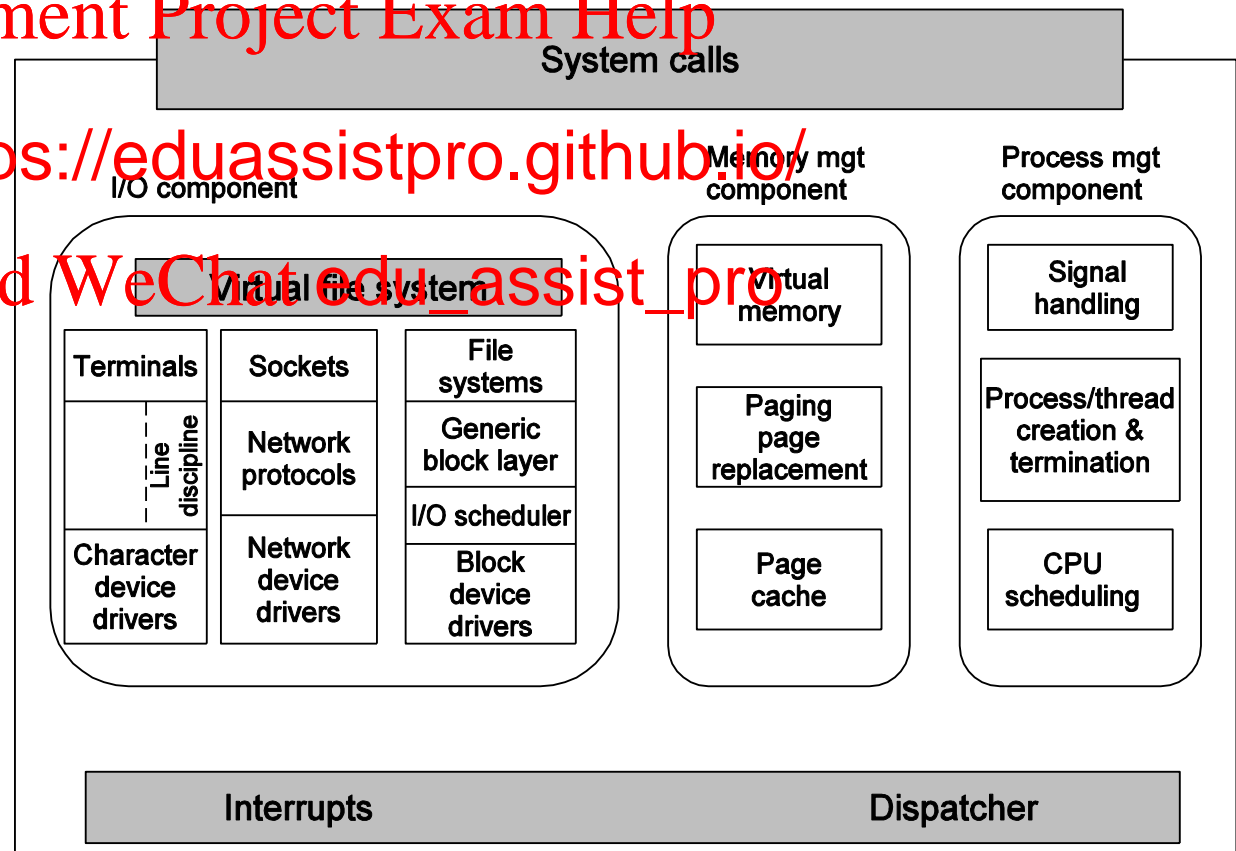

Assignment Project Exam Help

IO scheduler orders disk operation

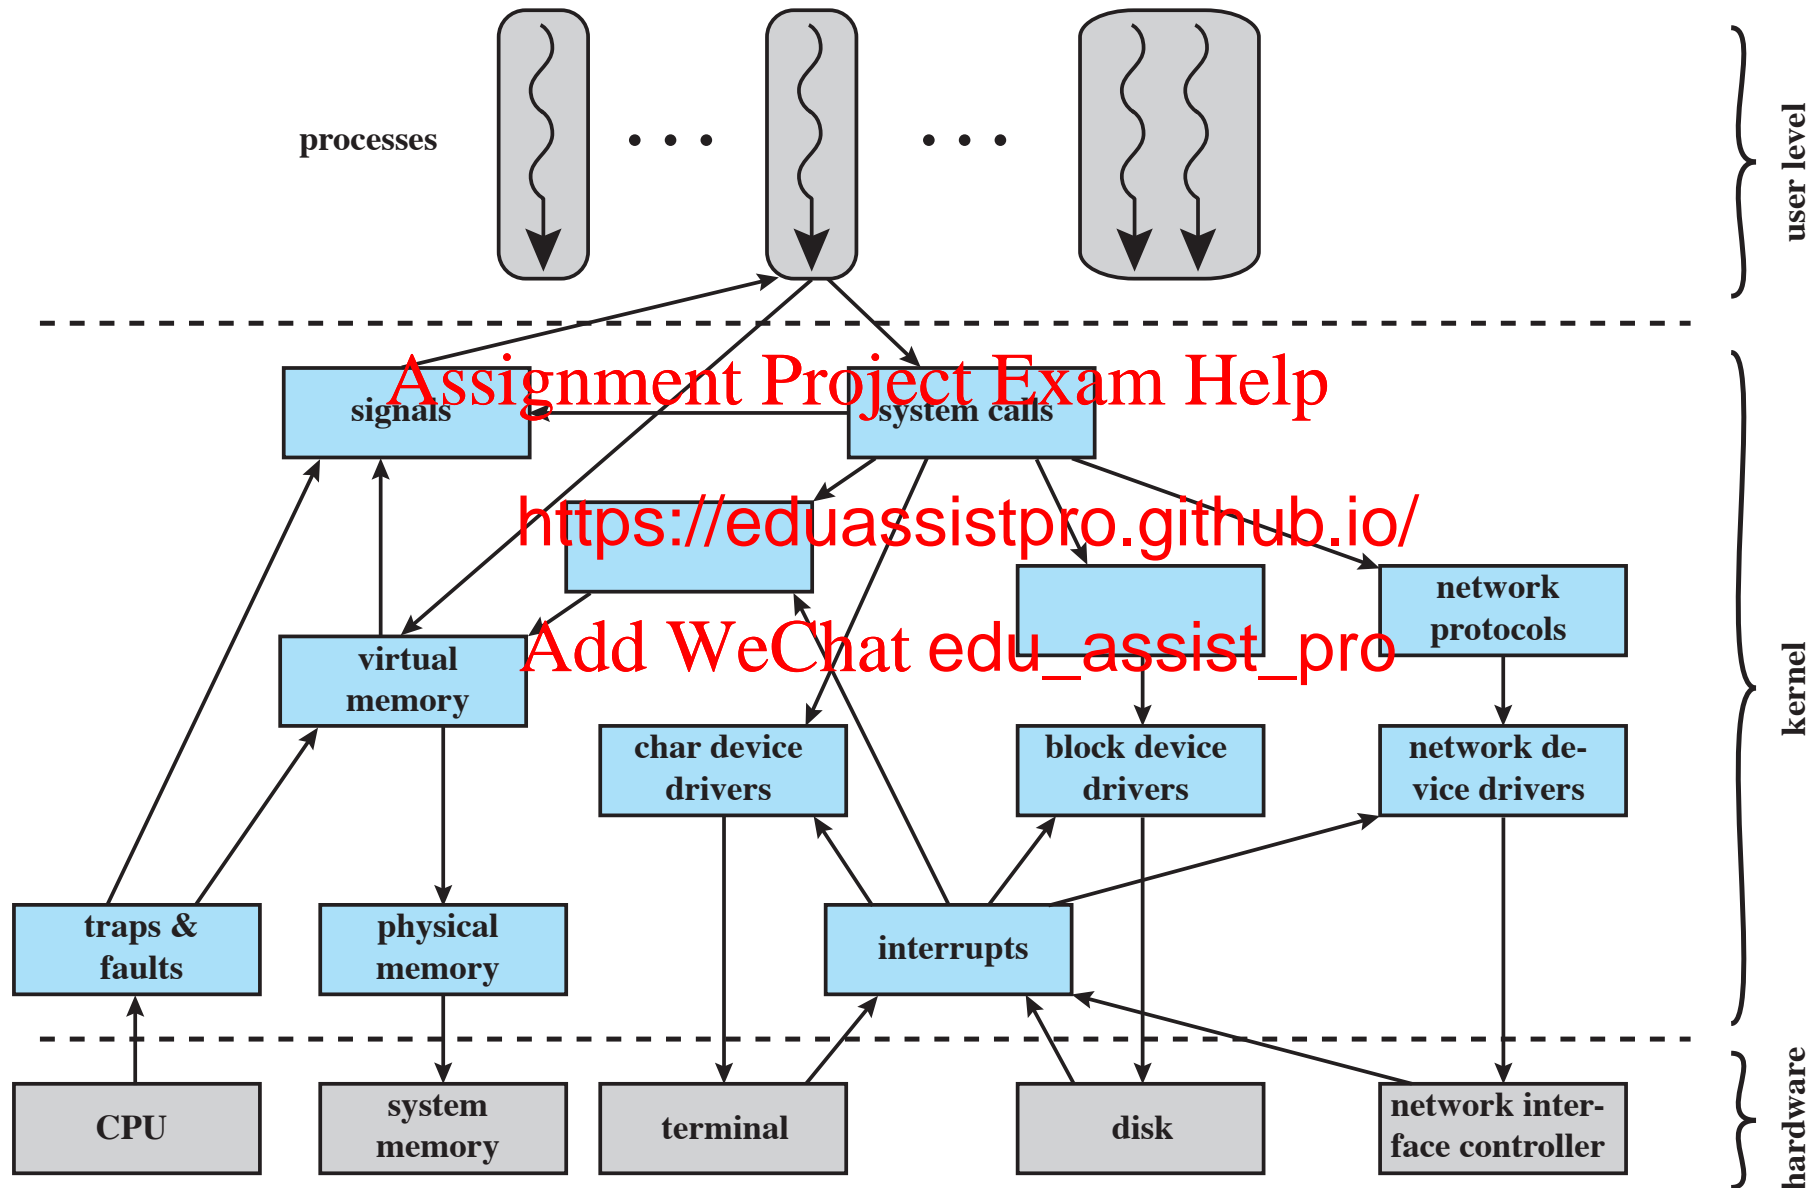

Monolithic:
Static in-kernel components and dynamically loadable modules with shared internal data structures

<https://eduassistpro.github.io/>

Add WeChat: edu_assist_pro

Linux Kernel Components

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

Kernel Questions

1. Why is the separation into a user mode and a kernel mode considered good operating system design?

Assignment Project Exam Help

<https://eduassistpro.github.io/>

2. Give an example in which the execution of a user process switches from user mode to kernel mode, and then back to user mode again.

Evolution of OS Code Sizes

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

source: Wikipedia 2010

Code bloat

- Is lines of code useful comparison for complexity?
 - e.g. Linux scheduler (50K LoC); Vista scheduler (75K LoC)

Summary

OS Functions

- Simplify programming: device abstraction; virtual machine; memory management, file systems.
- Support concurrency, resource sharing & synchronisation

Assignment Project Exam Help

Kernel Structure <https://eduassistpro.github.io/>

- Monolithic, Micro & Hybrid.

Add WeChat edu_assist_pro

Operating System complexity

Portable Operating System Questions

1. Explain why it is infeasible to build an operating system that is portable from one system architecture to another without any modification.

2. Describe two general parts that you can find in an operating system that has been desi
